Gameplay in Imazze! is rather simple: you must find the way out of the maze. If you're good enough, you can even get the highest score. All you need is to survive in the maze. As soon as you run into an obstacle, you'll have to make a decision: try to avoid it (that's the best strategy) or run into it. All kinds of obstacles are in the maze. Luckily, they're not difficult to avoid. The main challenge is that you don't know what is in the maze. The goal is to find a way out, but there are no maps or escape hatches. However, there are signs that help you find your way out. For example, if you see a field of flowers, then there is a path to go through. Or, if you see a locked door, you may find a bridge somewhere nearby. In order to get out of the maze you should press the right button, matching the combination of the color of the walls. The more matches you have, the more points you'll get. And the game gets even more challenging, when you find a vault: a special room where you can find special things that will be useful in the maze. But don't worry; if you're stuck in the maze, or if you got into a vault, you'll have time to think, because you can pause the game at any time. However, you're better off without thinking too much. There are many strategies to get out of the maze. If you're stuck, check the instructions at the bottom of the screen. But don't forget about the sign above that shows what key you need to press to solve the maze. Features: - 60 levels. - Pleasant music. - More than 2 hours of gameplay. - Simple controls. - Steam Achievements. If you like to play puzzle games, try Imazze! Wound healing after deep partial thickness burns. Partial-thickness burns are common in the UK and by the end of the decade there will be 300 000 partial-thickness thermal injuries to the upper limbs alone. The two most common sites in these injuries are the dorsal hand and the dorsal foot. It is estimated that over 45 000 people each year worldwide suffer partial-thickness burns and that, on average, one person dies every hour as a result of partial-thickness burns. Whereas approximately 60% of burns are covered with skin at 14 days, partial-thickness burns account for 15% of all hospital admissions. During the first 28 days, burns that are partial-thickness heal by contraction and congestion, which results in a raised, scabbed blister. Afterwards the blisters drain into shallow ulcers, which gradually become skin and subcutaneous tissue graft donor sites. This review provides a review of the latest evidence regarding superficial cellular and acellular changes in the burn wound. The authors aim to review the techniques available to date to help clinicians manage the burn wound following transfer to a specialist centre.
